Marine
Monitoring

Ocean State Report 2

Flagship publication: Ocean State Report #2

Provides a comprehensive and state-of-the art assessment of the state of the global ocean and European regional seas for the ocean scientific community as well as for policy and decision-makers.

Marine
Monitoring

NEW OCEAN MONITORING INDICATORS

CMEMS anchors its supports to Marine Conservations, Policies and SDGs by delivering new ocean monitoring indicators among which Ocean Acidification (e.g. used by EUROSTAT, see next slide), Sea Level including Thermosteric Rise and Arctic Freshwater.

Ocean Monitoring Indicators (OMI)

Track the changes in the ocean associated with climate change

Ocean Acidification
(Seawater pH)

Ocean Heat

Sea Level
including
Thermosteric Rise

Sea Ice Extent

Arctic
Freshwater

Marine
Monitoring

Next portfolio release in April 16 2019

Main highlights:

- **In situ Surface currents** from High Frequency Radars in all regional basins in Near Real Time
- **Global Ocean model** surface currents now including effects from **tides and waves** (new dataset in model product 024)
- ~~7km~~ **1.5km wave forecast model** in the European North West Shelves
- **Nutrient** concentration profiles (i.e. nitrate, phosphate and silicate) (2004 to 2018 from BGC-Argo).
- Surface ocean partial pressure of **carbon dioxide**, surface ocean downward mass flux of carbon dioxide expressed as carbon (positive for flux into the ocean) and **pH** on a regular grid ($1^\circ \times 1^\circ$) with a monthly resolution from 2001 to end of 2016

All dataset steps:

(1-2)

- satellite covariation
- combination method. T
- use of altimetry fields.

(3-4)

- in situ a compute

All datasets are obtained as a combination between satellite and in-situ data, processed in different steps:

(1-2)

- satellite data (SLA + SST) are projected onto the vertical via a multiple linear regression method and covariances deduced from historical observations. This step gives synthetical fields,

- combination between these synthetic fields with T/S in-situ profiles via an optimal interpolation method. This leads to combined fields.

- use of the thermal wind equation to combine absolute geostrophic current fields from satellite altimetry with the combined 3D T/S fields. This last step generates global 3D geostrophic current fields.

(3-4)

- in situ and satellite SSS are interpolated through a multivariate optimal algorithm, using SST to compute the interpolation weights.

The surface and 15m current derived from ERA INTERIM wind each individual component at the equator and

The surface and 15m ocean current velocities are obtained as the sum of the surface geostrophic current derived from altimetry and Ekman component derived applying an empirical Ekman model to ERA INTERIM wind stress . Accuracy on the total velocity field therefore depends on the accuracy of each individual component. It features an important spatial variability, with an increase of the error at the equator and in coastal area.

Waves

Significant Wave Height(m)

SWH from SATELLITE

- Jason-3, Sentinel-3A and SARAL/AltiKa
- Sentinel-3B added in 2019
- 3-Hourly files , 7x7km
- Surface only
- No forecast
- L3 along swath
- [July2017-ongoing]
- New product: Merged L4 planned in 2019

Monomission satellite along-track significant wave height. All the missions are homogenized with respect to a reference mission which is currently Jason-3 and calibrated on in-situ buoy measurements.

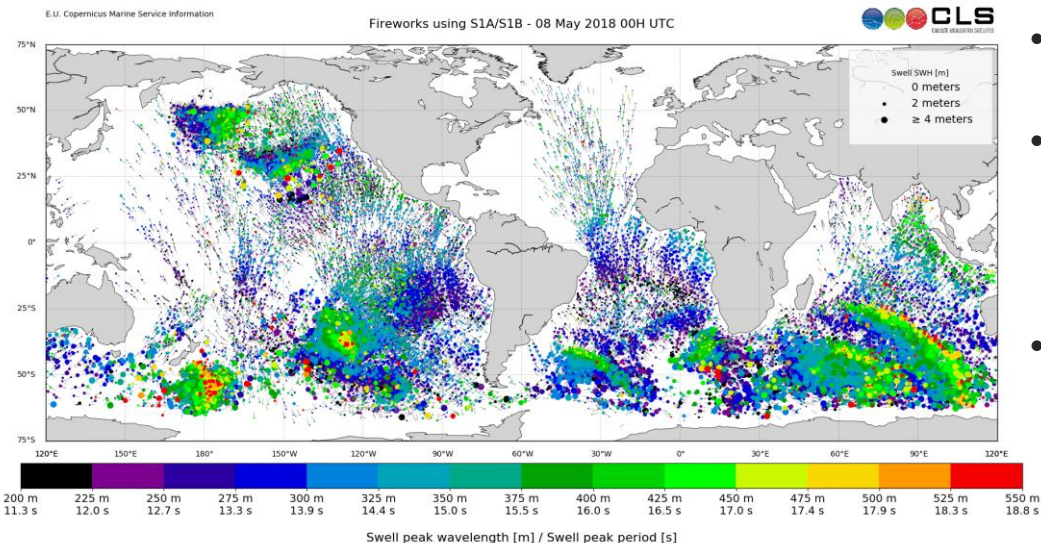

WAVE_GLO_WAV_L3_SWH_NRT_OBSERVATIONS_014_001

Waves

Significant Wave Height(m)

SWH from SAR SATELLITE

- Sentinel 1A-B
- Surface only
- **No forecast**
- **unique ability to measure the wave period and direction on top of the wave height**
- *allows following each single wave train in the world ocean from the time it is generated until it reaches the coast, sometimes more than 10 days after*
- **A single digital file contains an entire wave system that is all the wave trains originated from the same storm event, from its generation until 10 days later**
- from 2018-03-15 to Present
- 3-hourly-instantaneous
- [WAVE_GLO_WAV_L3_SPC_NRT_OBSERVATIONS_014_002](#)

In order to avoid confusion between various SST at different depth, CMEMS SEA SURFACE TEMPERATURE Satellite products provide with the following information:

- **SEA SURFACE TEMPERATURE (SST):**
 - Foundation SST (SST at a depth of about 10 meters, i.e. not influenced by diurnal cycle) (all SST products except one)
 - Skin SST (SST at a depth of about 10 micrometers, i.e. influenced by diurnal cycle) (only 1 product SST_GLO_SST_L4_NRT_OBSERVATIONS_010_014)

Sub-setting

All datasets are obtained as a combination between satellite and in-situ data, processed in different steps:

(1-2)

- satellite data (SLA + SST) are projected onto the vertical via a multiple linear regression method and covariances deduced from historical observations. This step gives synthetical fields,
- combination between these synthetic fields with T/S in-situ profiles via an optimal interpolation method. This leads to combined fields.
- use of the thermal wind equation to combine absolute geostrophic current fields from satellite altimetry with the combined 3D T/S fields. This last step generates global 3D geostrophic current fields.

(3-4)

- in situ and satellite SSS are interpolated through a multivariate optimal algorithm, using SST to compute the interpolation weights.

Monitoring

ENERGY: Renewable Energy TEST SITE

The Biscay Marine Energy Platform (**BiMEP**) is an open sea test site with grid connection for demonstrating and validating **wave energy collectors and floating wind** platforms. BiMEP provides manufacturers with ready-to-use facilities to test technical and economic feasibility of their prototype.

BiMEP and IH Cantabria have developed a Prediction System to forecast wind, wave, currents and sea level conditions to be considered in the **planning of marine operations at BiMEP** and feed the Decision Support System developed in TRL+ project. The Copernicus Marine Service **physics and wave** models are used as forcing conditions in a very high resolution model.

Marine
Monitoring

ENERGY: Offshore platforms

Offshore platforms and related ships need to be fully operational 24/7 whatever the weather and sea conditions.

CMEMS ocean model currents and waves products are used to build a met/ocean dashboard. Offshore platform operators rely on such dashboard to plan operations at sea and publish warning messages.

Marine
Monitoring

RISK AT SEA: CONSTRAINT EVALUATION ON SEA-EXPOSED MATERIAL

A harsh ocean environment with strong winds and waves over decades of use causes significant wear and tear on offshore structures. The angle from which waves hit a platform, and the wave height are important factors, but in addition the wave frequency is an important factor due to the resonance frequency of the structure itself.

AHPA, Asset Health and Probabilistic Analyses, focuses on **probability analyses of fractures and strains on offshore structures**. The Copernicus Marine Service wave height combined with period is used to predict the 3-dimensional motion of floating bodies.

AHPA

Wave Height (meter) Evolution during 5days in October 2017

MARITIME NAVIGATION

Marine
Monitoring

CMA CGM and ACTIMAR use Ocean Current Observations and Forecast to find the best possible route and guide its fleet thanks to its Fleet Navigation & Support Centre.

Their Target : Save 1% thanks « current routing » (60 000t fuel or 180 000t CO₂ for the whole fleet).

MARITIME NAVIGATION IN HARBORS

SAMOA: MET-OCEAN CONDITIONS FOR SPANISH PORT AUTHORITIES

In the SAMOA project, led by Puertos del Estado, Spain, a total of 18 port authorities are participating. The service consists of several modules including met/ocean dashboard. CMEMS model products are used as boundary conditions to local coastal models.

Puertos del Estado

Marine
Monitoring

WATER QUALITY

MONITORING AND FORECASTING WATER QUALITY IN THE BAY OF MARSEILLE

The SUEZ subsidiary SERAMM and SUEZ center Rivages Pro Tech develop tools and services for real-time monitoring and forecasting of the nearshore environment. Local authorities in the Marseille area in charge of bathing and coastal water quality have requested the SERAMM and Rivages Pro Tech services. CMEMS ocean models used as boundary conditions allow to better represent the local impact of ocean circulation features like upwelling episodes in the bay.
